

PRESS RELEASE**HEDNO modernizes and upgrades the procedure of data update in Real Estate Tax with the new web application**

HEDNO created a new web application for the Real Estate Tax which upgrades and modernizes the communication between Municipalities and Corporation.

HEDNO keeps a data base with the real estate data, such as the surface in square meters and the zone price, that are provided by the Municipalities and it has the competence to forward them to electricity Suppliers so as they can calculate Municipal charges, Municipal taxes and Real Estate Tax that are collected from their customers in order to be paid to the relevant Municipalities.

The new web application will gradually replace the existing way of dispatch (via mail) of changes in real estate data of the whole country's Municipalities to the Corporation, resulting in limiting drastically bureaucratic procedures and delays.

The country's Municipalities will be able, after receiving their unique access code, to insert modification files, to check possible incorrect registrations and proceed directly to all the necessary corrections.

With the new contemporary electronic procedure, Municipalities, without upgrading their existing IT systems, will improve the speed of property data update for the Electricity Suppliers.

This application operates as pilot project in the Municipalities of Piraeus and Glyfada and will be extended gradually to all Municipalities of the country.

The upgrade of HEDNO's communication with Municipalities is part of the Corporation's client-oriented strategy, aiming mainly at reliable and quality provision of services not only to consumers, but also to other cooperating bodies.
